

Repository:

A repository is the central home for project files, documentation and revision history

Collaboration:

A collaboration is the way to share our project with other.

We can give access to them to edit the file and we can stop the access when we want.

Steps to Create a Repository:

- ★ Open GitHub
- ★ New repository
- ★ Choose a clear name
- ★ Add description
- ★ Choose visibility
- ★ README
- ★ Create

Repository Settings:

- ★ General : Name description.
- ★ Access : People permission
- ★ Branches : Branch controls
- ★ Pages : Website publishing
- ★ Danger Zone : Destruction

Uploading and Organizing Files :

Move the file 'into' the repository, then make them easy to find

- 1) Upload : Safe practice, Add to repo, Commit changes
- 2) Organize : Group similar file. Use meaningful name.
- 3) Check : Confirm files and keep the structure simple.

README ← Welcome Notes

It includes "What is this?", "Why it is useful", "How do I start", "Who created?". It is the description of the repo.

Visibility:

- Public ← Suitable content can be seen broadly. broadly.
- Private ← Access is restricted.

Always check privacy, permissions and secrets before publishing

Repository Templates :

- ★ A template is a reusable project blueprint.
- ★ To reduce our work we can use the same template again and again.

File History and Commit Concept:

A commit is a meaningful checkpoint.

Start

Add chart

Fix bug

Update docs

Commit Changes

Commit = Save this important checkpoint.

Version History, Download, Delete.

- ★ Version History: Find earlier checkpoints.
- ★ Download: Can be downloaded as ZIP file.
- ★ Delete: Deleted repo can't be recovered.
