

Collabration using Github

Collabration is nothing but a Shared workspace

Repository Sharing

Share the project with the people who need access

Collabrators

People with access can contribute according the permission available to them

Issues and Discussions :

Use ~~and~~ Issues to track work and problems. Use Discussions for questions, ideas and community conversations.

Branch : A sepearte line of work

Pull Request : A request to review and merge.

Fork : A copy of another repository under your account.

Github Notifications

Notifications help team members to notice activity.

- Mention : Someone asks you directly
- Issues : A task or problem changed.
- Pull Request : A review or update
- Discussions : A conversation

Project, Labels and Milestone

Turn a collection of tasks into visible plan

Project	Label	Milestone
Organize and track work	Tag work, feature, documentation	Group issues toward meaningful goal.

Comments ~~Commit~~, Suggestions and Reviews

Good Collaboration is not only about changing files - it is about explaining and improving changes

A collaborative repository should be understandable even when the original author is not available.

Naming Conventions

Use meaningful names

Example:

attendance analysis ✓

abc123 ✗

Documentation Standards

Explain:

- * Purpose
- * Structure
- * Important decision
- * Collaboration rules.

Collaborations becomes safer when the project is organized and valuable work has recovery options.

File organization

keep related files together

Use predictable folder.

Backup ~~Activity~~ Strategy

Repository history helps recover previous data

Ethics

- Open Source : Use and Contribute
- Copyright : Don't assume everything online is free to copy.
- Licensing : A license explains what others may do with work.
- Academic Integrity : Give credit. Do your own work.
